

How to Integrate

Add behavioural analytics, drop-off prediction, and sentiment insights to your storefront in under five minutes — no SDK, no backend changes, no framework lock-in.

1 Overview

The CJA tracking script is a single, framework-agnostic JavaScript file. It works identically on plain HTML, React, Next.js, Shopify, and WooCommerce storefronts. Once installed, every click, scroll, page view, and funnel step on your site streams into your private CJA dashboard — isolated from every other client by a unique site ID.

2 Add the Snippet

Paste the following into the `<head>` of your site, before the closing `</head>` tag. No other code changes are required.

```
<script>
  window.CJA_CONFIG = {
    site_id: "YOUR_SITE_ID",
    track_endpoint: "https://api.yourplatform.com/api/track",
    funnel: ["/products", "/cart", "/checkout", "/order-complete"]
  };
</script>
<script src="https://cdn.yourplatform.com/tracker.js" async></script>
```

That's it — the script self-initialises on page load and begins tracking immediately.

3 Configuration Reference

Parameter	Description
site_id	Your unique client identifier, issued when you sign up. Tags every event so your data stays isolated from other clients.
track_endpoint	The CJA ingestion URL events are sent to. Provided in your onboarding email — do not modify.
funnel	An ordered array of URL paths describing your conversion journey (e.g. product page → cart → checkout → confirmation). Supports partial path matching for dynamic routes such as <code>/product/:id</code> .
debug (optional)	Set to true during setup to log every tracked event to the browser console. Remove or set to false before going live.

4 What Gets Tracked

- Page views and route changes (including single-page app navigation)
- Clicks, with on-page coordinates for heatmap generation
- Scroll depth per page
- Funnel progression, mapped automatically against your configured funnel array
- Optional customer feedback text, scored for sentiment

All data is batched client-side and sent every few seconds, with a final flush on tab close — so your dashboard stays current without adding load to your site.

5 Why It's Safe to Install

- Zero dependencies — pure JavaScript, no library conflicts with your existing stack
- Fails silently — a tracking error never breaks your storefront or checkout flow
- Non-blocking — all requests are asynchronous and never delay page rendering
- ~8KB — negligible impact on page load time

6 Verify Your Installation

Set debug: true, open your site, and confirm events tagged [CJA] appear in your browser console as you click and scroll. Then log in to your CJA dashboard — your first sessions should appear within seconds, under your site name in the site selector.

Need help? Contact your onboarding specialist or reply to your welcome email with your site_id.
